

FX MOMENTUM / TRADE KEEPER

How to Install FXM Trade Keeper on Your Mac

A simple 5-minute guide. Follow these steps in order.

1. Find the installer file

You download one file from FX Momentum. Pick the one for your Mac:

- FXM-TradeKeeper-2.0.0-Mac-x64.zip (Intel Macs)
- FXM-TradeKeeper-2.0.0-Mac-arm64.zip (Apple Silicon / M-series Macs)

This “.zip” file contains the app. Keep it somewhere easy to find, like your Downloads folder or Desktop.

2. Open the installer

- Double-click the .zip file. macOS automatically unpacks it into a folder called “FXM Trade Keeper”.
- Inside it you will find the app: “FXM Trade Keeper.app”. That is the app you will move into Applications.
- macOS may warn that the file “was downloaded from the internet and may contain harmful software.” Click OK / Allow. This is a normal warning for software that is not from the Mac App Store.

3. Move the app to your Applications folder

- Open the unpacked folder and drag “FXM Trade Keeper” onto the Applications folder. If a side shortcut list is visible, drag it to your Applications folder.
- Wait a few seconds for it to copy. You can delete the .zip file afterwards.

4. First time opening the app

Because the app is not sold through the Apple App Store, macOS uses a protection called Gatekeeper that may try to block the first launch. This is normal and does NOT mean the app is infected. Use any ONE of the following methods.

Method A — right-click, then Open (easiest)

- Open your Applications folder (Finder → Applications).
- RIGHT-CLICK (or two-finger click) the “FXM Trade Keeper” icon.
- Choose “Open” from the menu.
- If macOS shows a warning such as “unidentified developer”, “cannot be opened because Apple cannot check it for malicious software”, or “app downloaded from the internet – it may contain harmful software”, click “Open” or “Open Anyway” again.

Method B — System Settings

- Open System Settings (Apple menu → System Settings).
- Go to “Privacy & Security”.
- Scroll down to the “Security” section.

- Next to “FXM Trade Keeper” click “Open Anyway”, then confirm with “Open”.
- On older macOS versions this is: System Preferences → Security & Privacy → General → “Open Anyway”.

Method C — remove the quarantine flag (use this if the methods above fail)

- Open Terminal (Finder → Applications → Utilities → Terminal).
- Copy and run this command, then try opening the app again:

```
xattr -dr com.apple.quarantine "/Applications/FXM Trade Keeper.app"
```

You only do this special step ONCE. From now on, just double-click the app normally.

5. Use the app

- The first time it opens, it shows a sample / demo trading journal.
- Go to Settings in the app to set up your profiles, and use Import to bring in your own trades.
- Everything is stored locally on YOUR Mac — no account and no internet needed for core features.
- Use “Export” in Settings to back up your journal as a .tkjournal file whenever you want.

6. Quick help if something looks odd

“I see: ‘downloaded from the internet. it may contain harmful software.’”

- This is a standard macOS Gatekeeper warning for any app that is not from the App Store. The app is safe. Use Method A or B above to open it.

“I don’t see the Open option”

- Make sure you are RIGHT-clicking (control-click also works). On a trackpad, right-click is usually a two-finger click.

“I get: cannot be opened because the developer cannot be verified”

- This is the same first-time warning. Use right-click → Open, or System Settings → Privacy & Security → Open Anyway.

“The app says it is damaged and can’t be opened”

- Usually caused by macOS quarantine flagging an incomplete download. Re-download the .zip, or run the xattr command from Method C before opening the app. The app itself is fine.

“The installer is gone / there’s a copy on my Desktop”

- You can safely delete the .zip file after installing — the app is safely in your Applications folder and the .zip is no longer needed.
